

Return on Investment (ROI) for TierDeveloper

February 17, 2006

TierDeveloper is an object-to-relational mapping code generator for .NET and cuts down your development time by 50%. TierDeveloper generates the following for you:

1. Business and data objects in C# and VB.NET
2. Web Services interface for these objects
3. Windows Forms and ASP.NET applications
4. Remote Web Services client in Windows Forms

Although, TierDeveloper cuts down your development by 50%, we'll take a very conservative figure of 25% time savings in calculating the return on investment below.

If you have a team of 5 developers (not including any architects, project managers, and other staff) and your project is 6 months long (typical for most projects), your development cost is roughly as following:

Number of developers	5
Investment	
TierDeveloper price	\$1495 per developer
Total investment in TierDeveloper	$1495 * 5 = \mathbf{\$7475}$
Cost Savings	
Average annual cost per developer	\$100,000/year (or \$8300/month)
Project duration	6 calendar months
Project size	$5 * 6 = 30$ person-months
Cost of development	30 person-months * \$8300/month
Cost of development	\$249,000
TierDeveloper time savings	25% (although much higher in reality)
TierDeveloper cost savings	$25\% * \$249,000$
TierDeveloper cost savings	\$62,250
Profit from TierDeveloper (in six months)	
Profit after six months	$\$62,250 - \7475
Profit after six months	\$54,775

As you can see, your ROI is almost immediately (in fact after the first month) and from that point onward, TierDeveloper brings you nothing but savings.
